

Key Property: Finite Additivity

If events A and B are disjoint, then

$$\underline{P(A \cup B)} = \underline{P(A)} + \underline{P(B)}$$

Using finite additivity, we can derive the following results

a. For any event A , $P(A^c) = 1 - P(A)$

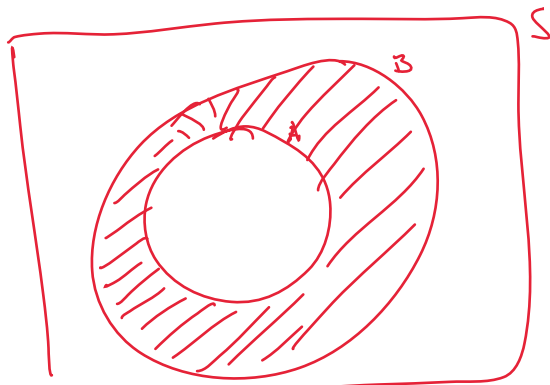

► In particular, since $P(S) = 1$ then $P(\emptyset) = 0$

→ b. If $A \subset B$, then $P(A) \leq P(B)$

→ c. $P(A \cup B) = P(A) + P(B) - P(A \cap B)$

Exercise 1: Show a, b, and c (use Venn Diagrams)

$$\begin{aligned}
 P\left(\underbrace{(B \cap A^c) \cup A}_B\right) &= \underbrace{P(B \cap A^c)}_{\geq 0} + P(A) \\
 \underbrace{P(B)}_{\text{Disjoint}} &= \underbrace{\quad}_{P(A) \leq P(B)} + \underbrace{P(A)}_{\checkmark}
 \end{aligned}$$

Example 1

Experiment: Toss a fair coin twice. Let's represent an outcome by the results in order of occurrence.

- ▶ $S = \{HH, HT, TH, TT\}$
- ▶ Some events:
 - ▶ $A = \{HH\}$
 - ▶ $B = \{ \text{first coin is heads} \} = \{HH, HT\}$
 - ▶ $C = \{ \text{at least one tail} \}$
- ▶ Some probabilities
 - ▶ $P(A) = 1/4$
 - ▶ $P(B) = 1/2$
 - ▶ $P(C) = 3/4$

Exercise 2

Use experiment in example 1 (toss coin twice) and answer the following

- a. $P(A^c) = 1 - P(A) = 1 - 1/4 = 3/4$
- b. $P(A \cup B) = P(A) + P(B) - P(A \cap B) = 1/4 + 1/2 - 1/4 = 1/2$
- c. $P((A \cap C)^c) = P(\emptyset^c) = P(S) = 1$

$$\hookrightarrow 1 - P(A \cap C) = 1 - P(\emptyset) = 1 - 0 = 1$$

Finite Sample Spaces

- ▶ S is a finite sample space if there is $N \in \mathbb{N}$ such that $S = \{s_1, s_2, \dots, s_N\}$.
 - ▶ We do require s_1, \dots, s_N to be different from each other, i.e., $s_i \neq s_j$ if $i \neq j$
 - ▶ A direct consequence is that the event $\{s_i\}$ is disjoint of $\{s_j\}$ for $i \neq j$
- ▶ The outcomes are equally likely if

$$P(\{s_1\}) = P(\{s_2\}) = \dots = P(\{s_N\})$$

- ▶ Since $\{s_i\}$ is disjoint of $\{s_j\}$ for $i \neq j$, then using finite additivity

$$\sum_{i=1}^N P(\{s_i\}) = P(\cup_{i=1}^N \{s_i\}) = P(S) = 1$$

Finite Sample Spaces (continued)

- ▶ It follows that

$$P(\{s_i\}) = \frac{1}{N}$$

- ▶ For any event $A \subset S$, if S is finite with equally likely outcomes then

$$P(A) = \frac{\#A}{\#S}$$

where $\#A$ is the total number of outcomes in A

Exercise 3

Julia is among 30 students the may be randomly selected to form a committee of 3 people

- a. If the committee needs 1 president, 1 vice president, and 1 secretary, what is the probability that Julia is the president? ^A

$$\blacktriangleright P(A) = \frac{\#A}{\#S} = \frac{1 \cdot \cancel{29} \cdot \cancel{28}}{30 \cdot \cancel{29} \cdot \cancel{28}} = \frac{1}{30}$$

- b. If the committee needs 1 president, 1 vice president, and 1 secretary, what is the probability that Julia is part of this committee? ^B

$$\blacktriangleright P(B) = \frac{\#B}{\#S} = \frac{(1 \cdot \cancel{29} \cdot \cancel{28}) \cdot 3}{30 \cdot \cancel{29} \cdot \cancel{28}} = \frac{1}{10}$$

- c. If the committee needs 3 members without any given roles, what is the probability that Julia is part of this committee?

$$\blacktriangleright P(C) = \frac{\#C}{\#S} = \frac{1 \cdot \binom{29}{2}}{\binom{30}{3}} = \frac{\frac{29!}{2!27!}}{\frac{30!}{3!27!}} = \frac{1}{19}$$

Conditional Probability

- ▶ If B is an event, we say that B has occurred if one of the outcomes in B is the result of the experiment
 - ▶ In the two-coin example,
 $B = \{ \text{first coin is heads} \} = \{HH, HT\}$. If B has occurred the resulting outcome was either HH or HT .
- ▶ The conditional probability of A given B , written $P(A|B)$ is defined as

$$P(A|B) = \frac{P(A \cap B)}{P(B)} \quad (1)$$

- ▶ One way to think about this is, if B has occurred, only the outcomes in B are possible (the sample space has been restricted). Now, what is the probability that A occurs?
- ▶ In the two-coin example $A = \{HH\}$ and $P(A|B) = 1/2$

Conditional Probability

- ▶ If we multiply both sides of (1) by $P(B)$ we get

$$P(A \cap B) = P(B)P(A|B) \quad (2)$$

- ▶ This is the second formulation of conditional probability

Independence

Two events, A and B are independent if the probability of A does not change by the occurrence of B (or viceversa). When this happens, the following equations hold:

- ▶ $P(A|B) = P(A|B^c)$
- ▶ $P(A|B) = P(A)$
- ▶ $P(A \cap B) = P(A) \cdot P(B)$
